

AutoDubber offers a clip exchange solution that allows facilities to dub clips between different types of servers and/or the same type of server without a file transfer network.

AutoDubber compares the source server to the destination server and then automatically dubs the material to the destination server in real-time.

Let AutoDubber take control of resources at a media ingest workstation when not required for other tasks. Since video server codecs are a precious commodity, adding AutoDubber to a Dubber workstation is a great way to enhance functionality and operational efficiency without an increase in hardware cost.

## AutoDubber Key Features

- Automatic backup to another server by continually comparing the contents of the source server to the destination server and copying missing clip files
- Runs quietly in the background, therefore not interfering with the day-to-day operations
- Save man hours copying materials from one server to the other
- Copy between different brands and types of video servers
- Copy between same servers without a file transfer network
- Real-time copy process between servers
- Mirror content using existing equipment
