

ClipPanel is a multi-purpose editing tool that allows operators to control and edit any clip on the video server. It's very simple to use as its control is very similar to a VTR machine.

ClipPanel allows operators to record, play, set marks, add comments, trim, delete and fibre-copy clips on a video server. The application is capable of creating and extracting multiple clips from an original, which helps with program segment preparation. ClipPanel also has a drag and drop feature that allows operators to move clips quickly to and from TurboBrowser, Dubber and RapidPlayX. Operators can also remotely operate ClipPanel using SmartWedge, Crispin's GPI control.

ClipPanel gives operators complete control over any clip on the video server.

ClipPanel Key Features

- Quickly create multiple clips from an original for program segment preparation
- Remote operation of ClipPanel using SmartWedge, Crispin's GPI control
- Transfer clips from one server to another using Fibre Channel
- Clip verification function for video server clips
- Runs locally on a server or over the LAN
- Drag and drop user interface
- Attach comments to clips
