Crispin's Digital Transfer Agent (DTA) provides the missing link between catch servers and fully-automated, on-air presentation. DG Systems, FastChannel, MediaDVX and Vyvx have greatly simplified the way broadcasters receive commercial content.

Utilizing DTA, Crispin provides a seamless solution to automatically move commercials to a video server and prepare them for air.

DTA periodically reviews catch server content for new programs and populates the DTA view with low-resolution clips that operators can view to verify the correct commercial material. Metadata is simultaneously retrieved and stored. DTA either automatically issues (or the operator manually selects) commercials to be transcoded and transferred to the play-to-air video server. The required programs now reside on the video server, assembled and complete with program segment timing data in Crispin automation, ready for play-to-air.

Personnel may generate media status reports to compare record orders with the programs that have been imported. Crispin's Dubber (manual media acquisition tool) may be used to QC and verify program timings if necessary.

Combining Crispin's DTA with catch servers does much more than streamline workflow. It eliminates the need for manual tasks in the program acquisition process. No dubbing or segmenting of programs will be required for any catch server-delivered content. The digital transfer of programs from supplier to fully-automated on-air presentation is complete.

**Crispin supports Pathfire through an additional product, DTA - Pathfire. Please see this corresponding document for more information.*

Digital Transfer Agent - Catch Server Key Features

- Routinely detects new commercials and issues commands to automatically copy them to the play-to-air server
- Metadata is simultaneously retrieved and stored
- Automatic clip trimming
- Crispin's Dubber may be used for additional verification of segment timings
- Customer can assign the clip name according to rules defined in the playlist/dub list
- This product does not require any additional options to interface with the catch servers
