

DubberAssist is a video server media management tool that automates many tasks in systems that do not utilize Crispin's AssetBase media management. It automatically creates dub lists by comparing a playlist to actual video server content. This reduces the need for manual data entry and virtually eliminates errors in the dub process.

Operators may also generate a kill list to execute the deletion of one or more clips or daily promos, reducing the amount of old assets that exist on the video server. DubberAssist is designed to be installed on the media ingest workstation with Dubber and supports drag and drop of asset records directly into the Dubber application.

This valuable resource allows operators to manage their disk space effectively and reduce the potential for error in the dubbing process.

DubberAssist Key Features

- Simple but powerful media management tool for non-AssetBase automation systems
- Auto-create required material lists by comparing available playlists with actual server content
- Drag and drop asset records directly from DubberAssist into Dubber
- Delete one clip at a time or all clips contained in kill list
- Video server dub list generation
- Video server kill list generation
- Simple-to-use interface
